

## Everything on Logic

Verbose	Shorthand	Meaning
not	!	negation
and	&&	conjunction
or		disjunction
implies	=>	implication
else	,	alternative
iff	<=>	bi-implication

## Implication

$P \Rightarrow Q$

P implies Q

p	q	p implies q
true	true	true
true	false	false
false	true	true
false	false	true

## Else

The else operator is used with the implication operator

F implies G else H

(F and G) or ((not F) and H)

## Bi-implication

The  $\Leftrightarrow$  is two-way implication.

P iff Q or  $P \Leftrightarrow Q \rightarrow (P \text{ implies } Q) \text{ and } (Q \text{ implies } P)$

Either both are true or both false

## Nested Implication

C1 => F1,		C1 implies F1
C2 => F2,	OR	else C2 implies F2
C3 => F3		else C3 implies F3

## Some Shorthands

{F G H} is equivalent to F and G and H

$a \neq b$  equivalent to not (a=b), or, a not= b

### Equivalent Logical Expressions

<b>p and q</b>	<b>q and p</b>
<b>p and p</b>	<b>p</b>
<b>not not p</b>	<b>p</b>
<b>not (p and q)</b>	<b>(not p) or (not q)</b>
<b>not (p or q)</b>	<b>(not p) and (not q)</b>
<b>p implies q</b>	<b>(not p) or q</b>
<b>p implies q</b>	<b>(not q) implies (not p)</b>

### Quantified Expressions

$Q x:e \mid P$  where  $Q$  is a quantifier

<b>all <math>x:e \mid P</math></b>	<b>P holds for every x in e</b>
<b>some <math>x:e \mid P</math></b>	<b>P holds for at least one x in e</b>
<b>no <math>x:e \mid P</math></b>	<b>P holds for no x in e</b>
<b>lone <math>x:e \mid P</math></b>	<b>P holds for at most one x in e</b>
<b>one <math>x:e \mid P</math></b>	<b>P holds for exactly one x in e</b>

Several variables can be bound to the same quantifier;  $one\ x:e_1,\ y:e_2 \mid P$

Variables with same type can share declaration;  $all\ x,y:e \mid P$

### Let Expressions

When an expression appears repeatedly, or is a subexpression of a large complicated expression you can factor it out via a let expression

$Let\ x:e \mid A$

Means the same as the expression  $A$ , with each occurrence of  $x$  replaced by the expression  $e$
